# Overview

1. Introduction: Humans as Plasma Experimenters
2. Case Study: Starfish Prime
3. A Broader Theme: Anthropogenic Space Weather
4. Space Debris and Dusty Plasmas
5. Anthropogenic Electromagnetic Waves
6. Spacecraft Influences on the Environment
7. Synthesis and Outlook
8. Closing Thoughts

# Section 1

## Introduction

# The Evolving Use of Space as a Plasma Laboratory

- There is a long history of viewing space as a laboratory for basic plasma physics.
- Our growing human footprint in space affects the surrounding environment in numerous and potentially lasting ways.
- Increasingly, space is as much experiment as it is laboratory – potentially both complicating *and* enriching scientific opportunities.

## Section 2

# High Altitude Nuclear Explosions

# High Altitude Nuclear Explosions (HANE)

On July 9, 1962, the US detonated a 1.4 Mt nuclear device at an altitude of 250 mi above Johnston Island in the Pacific [source: DOE/NV—209-REV 16]

# Artificial Radiation Belts

- One of the most striking results of Starfish Prime was the creation of an intense, long-lived artificial radiation belt.
- The full spatial extent of the Starfish belt is not known, but it's thought that it extended beyond  $L=3$ , and Ariel showed enhancements out to  $5-6 R_E$

# Satellite Impacts

- Space was not as crowded in 1962 as it is today, but there were more than enough in orbit to know that Starfish Prime had a big effect.
- These observations contributed to the establishment of radiation hardening requirements for spacecraft, adopted for both civil and military domains.
- Due to cost, many commercial spacecraft do not use hardening.

# A First Foray Into Anthropogenic Space Science

Post-burst Emissions from Starfish HANE

## Anthropogenic

Characteristics: High energy, spatially localized within regions having magnetic conjugacy to burst.

Driver: Nuclear explosion and follow-on processes including particle precipitation.

Aurora Borealis

## Natural

Characteristics: Low(er) energy, may be spatially distributed across regions with magnetic conjugacy to magnetotail.

Driver: Magnetic reconnection (primarily) and follow-on processes including particle precipitation.

## Section 3

# Dust and Debris

# Space Debris

- Encounters with debris is a known threat for space assets and mitigation of debris is a driver of de-orbit requirements for all new missions.
- Unplanned or unusual human activity (explosions, ASAT tests) can (and do) cause rapid increases in the debris population.

# The Debris Distribution

Source: National Academies  
<https://nap.nationalacademies.org/read/4765/chapter/6>

## Debris damage to Hubble

Source: NASA ODPO  
<https://www.orbitaldebris.jsc.nasa.gov/photo-gallery/>

# Space Dust – The Tail of the Distribution

- A robust power-law distribution suggests scale-free processes.
- In this case, debris-debris collisions can be inferred to be causing interactions create an ever-growing but ever-smaller cascade of collision products.
- Observations are consistent with scaling to micron and likely down to nanometer – dust – scales.
- Potential for long-term evolution of plasma environment. *If... or when?*

## Havnes Parameter

$$P = 4\pi \lambda_D^3 n_d \left( \frac{r_d}{\lambda_D} \right)$$

- $P \ll 1 \rightarrow$  Dust in plasma
- $P \gg 1 \rightarrow$  Dusty plasma

## Section 4

# Electromagnetic Noise

# VLF Transmitters

- The DEMETER satellite observed very-low frequency (VLF) energy enhancements that were directly traceable to back to ground-based VLF emitters.
- VLF transmissions are used for long-range naval comms.
- Signatures of precipitating particles are consistent with VLF-induced scattering.

# Electrostatic Discharge

- The interaction between satellites and the environment is also a source of both routine and exceptional noise.
- Primary cause is interaction of satellite and natural plasmas.

## A Dead NASA Satellite Has Sent a Strange Radio Signal to Earth — Here's How

Learn how a deactivated satellite sends signals from beyond, not by reviving its systems, but by inadvertently setting off sparks.

### Radio frequency transients correlated with electron flux [D] measured on-board the SPT-Sat6 (Nag et al., 2025)

# Constellation Effects

- The presence of Unintended Electromagnetic Radiation (UEMR) from large constellations of spacecraft is increasingly prominent in the 30-300 MHz (VHF) frequency range
- May impact lightning science and radio astronomy (early observations from the Square Kilometre Array radio telescope)
- There is already a well-known impact at optical frequencies.

## Section 5

# Satellite Signatures

# Signatures of Moving Spacecraft

Current hypotheses suggest that space objects produce detectable plasma signatures (this is the basis of the IARPA SINTRA program, <https://www.iarpa.gov/research-programs/sintra>).

## Section 6

# Outlook

# Challenge and Opportunity

- This is an incredibly interesting and challenging time for space science. Not only do we have a proliferation of measurements and interest from diverse stakeholders, but we may also have a complexification due to ***interaction and feedback between humans and the space environment***.
- Space, particularly near Earth, can no longer be considered a pristine natural laboratory.
- Unless priorities and geopolitics change abruptly, we as a scientific community are going to have to come to terms with this new complexity. Historical results may – some day, maybe soon – no longer represent current realities and we will have to revisit core facts *and* assumptions about our space environment.

# Thank You!
